Popular PHP Repositories on GitHub

Using PHP and MySQL, complete the following:

1. Use the GitHub API to retrieve the most starred public PHP projects. Store the list of repositories in a MySQL table. The table must contain the repository id, name, url, created date, last push date, and number of stars. Feel free to add any additional information to the table.

   Useful links from the GitHub API documentation:
   https://developer.github.com/v3/
   https://developer.github.com/v3/search/

2. Using the data in the table created in step 1, create an interface that displays a list of the GitHub repositories and allows the user to click through to view details on each one. You are free to design the interface however you like, as long as all of the required fields in task #1 are displayed in either the list or detailed view.
